Activity

1) CCTV image with salt and pepper noise

Technique : Median filtering

Reason : It removes unwanted black and white dots from the image. It also preserves the edge of objects while reducing noise.

2) Satellite image corrupted by Gaussian noise

Technique : Gaussian filtering

Reason : Gaussian filtering reduces random noise and smooth the image.

A medical X-ray image has random noise but fine edges must be preserved.

Technique : Bilateral Filtering

Reason : It reduces noise while preserving important edges and fine details.

A Scanned document has black & White dots scattered randomly.

Technique : Median filtering

Reason : It removes unwanted black & white dots and improves document clarity.

A low-light image show heavy gain without clear boundaries.

Technique : Non-Local Means Denoising

Reason: It reduces heavy noise while preserving important image details and boundaries.

6) A foggy road image has very low contrast.

Technique: Contrast Enhancement using histogram Equalizati

Reason: It improves contrast and makes object in the foggy image more visible.

7) A underwater image appears dull and wasted ou

Technique: Color correction & Contrast Enhancement

Reason: These technique improve color balance, brightness and contrast making underwater objects clearer.

8) A chest X-ray shows poor visibility of internal structure.

Technique: Contrast Limited Adaptive Histogram Equalization

Reason: CLAHE improve local contrast and make intern structure more visible.

9) A night time traffic image lacks intensity variation.

Technique: Histogram Equalization

Reason: It improves intensity distribution and enhance the visibility of vehicles and other objects.

10) A grayscale image uses only a narrow intensity rang

Technique: Contrast Stretching

Reason: It expands the intensity range and improves the overall appearance of the image.
